

Yarn Berry Upgrade - Installer Update

What Changed

The installer has been updated to use **Yarn Berry (latest version)** instead of the outdated Yarn 1.x.

Before (Yarn 1.x):

- Old Yarn 1.22.22 via npm or package repositories
- Legacy cache commands (`yarn cache clean --force`)
- Old configuration directories (`~/.yarn` , `~/.config/yarn`)

After (Yarn Berry):

- Latest Yarn via corepack (preferred) or npm
 - Modern cache commands (`yarn cache clean`)
 - Clean removal of old installations before upgrade
 - Better Node.js compatibility
-

Installation Process

The updated installer now:

1. Removes all old Yarn installations:

- Uninstalls via npm, apt, yum, dnf
- Removes old repository configurations
- Cleans up legacy directories

2. Installs modern Yarn:

- Uses `corepack` (Node 14.19+) for best results
- Falls back to `npm install -g yarn@latest`
- Enables latest Yarn Berry features

3. Uses modern commands:

- `yarn cache clean` (no `-force` flag needed)
 - `yarn install --network-timeout 300000` (Berry compatible)
 - Proper PATH management
-

Benefits

- **Latest features:** All modern Yarn Berry capabilities
- **Better performance:** Improved dependency resolution
- **Security:** Latest security updates and patches
- **Compatibility:** Better Node.js and package ecosystem support
- **Clean installation:** No conflicts with old versions

For Existing Users

If you have an existing installation with old Yarn, the installer will:

1. **Automatically detect** old Yarn installations
 2. **Safely remove** them before installing the new version
 3. **Install latest Yarn** using the best available method
 4. **Verify installation** and provide fallback options
-

Manual Upgrade

If you want to upgrade manually on an existing system:

```
# Remove old Yarn
npm uninstall -g yarn
sudo apt-get remove -y yarn # or yum/dnf

# Install latest Yarn
corepack enable
corepack prepare yarn@stable --activate

# Verify
yarn --version # Should show 4.x.x
```

Verification

After installation, you should see:

- Yarn version 4.x.x (Berry)
 - Modern cache commands work
 - Better dependency installation
 - No conflicts with old versions
-

 **Your Music-U-Scheduler installer now uses the latest and greatest Yarn!**
